INSTRUCTIONS

1. Do not open this problem brochure until the signal to begin is given.

2. Write your examinee ID below on this cover.

3. An answer sheet and a draft sheet accompany this brochure. Write down your examinee ID on these sheets.

4. The USB memory delivered beforehand to each examinee contains ASCII text files: a.txt, b.txt and c.txt. Newline is represented by carriage return (CR) followed by line feed (LF) in the file.

   Before the examination starts, copy these files to your PC and browse them. Make sure you can see text files and keep your hands away from your PC. If you cannot read the files properly, consult the test supervisor. The contents of the USB memory are common to all examinees.

5. You may choose your favorite programming languages.

6. You may consult only one printed manual of a programming language in the examination. You can use or copy any libraries or program segments existing in your PC, but you cannot connect to the Internet.

7. By the end of the examination, make a directory/folder on your PC, whose name is the same as your examinee ID, and put your program files and related files into the directory/folder. Copy the directory/folder onto the delivered USB memory.

8. At the end of the examination, the USB memory, the answer sheet and the draft sheet are collected.

9. After these are collected, stay at your seat, until all examinee program results have been checked briefly by the test supervisor.

10. After the brief check, try to save your program execution environment on the PC so that you can run your program as soon as possible during the oral examination in the afternoon.

11. Leave your PC and this brochure together in the room for the oral examination and leave the room until you are called.

This is a blank page.
Consider a directed graph whose vertices and arcs (directed edges) increase and decrease with time.

Let $G(t) = (V(t), A(t))$ denote a directed graph at time $t$, where $V(t)$ is a set of vertices and $A(t)$ is a set of arcs at time $t$. Let $(v_x, v_y)$ denote an arc from a vertex $v_x$ to $v_y$. The initial state is $G(0) = (V(0), A(0))$ where $V(0) = \{v_0\}$ and $A(0) = \{}$. Let $R(t)$ be a root-set: the set of vertices consisting of the vertex $v_0$ and all reachable vertices from $v_0$ at time $t$. Reachable here means the vertex can be reached after traversing any number of arcs.

Each line of text files in the USB memory describes an operation that increases or decreases vertices or an arc. The operation at line $t$ finishes at time $t$.

Answer the following questions from Q1 to Q3. Write your answers to all questions on the answer sheet. Write your answers referring to the output of your computer program if there are no other instructions. You do not need to write down your program on the answer sheet. You are required to explain your program at the oral examination.

Q1. Consider a directed graph where vertices and arcs increase with time.

An operation Add-VA is defined as follows: given a vertex $v_x$ followed by a vertex $v_y$, apply the following operations to $G(t - 1)$ and generate $G(t)$:\(^{11}\)

\[
\begin{align*}
V(t) &= V(t - 1) \cup \{v_x, v_y\} \\
A(t) &= A(t - 1) \cup \{(v_x, v_y)\}
\end{align*}
\] (1) (2)

In the text file a.txt and other text files, the operation Add-VA is denoted as a line:

$x\rightarrow y$

where $x$ and $y$ are integers from 0 to 10000, which correspond to vertices from $v_0$ to $v_{10000}$, respectively. The operation at line $t$ finishes at time $t$. An example is shown on the next page.

The directed graph $G_a = (V_a, A_a)$ is the graph which results after applying all operations in the text file a.txt to $G(0)$. Answer the following questions.

1-1 Write the number of vertices $|V_a|$ of the graph $G_a$.

1-2 Write one of the vertices which have the maximum out-degree in the graph $G_a$ and its out-degree. Similarly, write one of the vertices which have the maximum in-degree in the graph $G_a$ and its in-degree\(^{12}\).

1-3 Write the time $t_v$ where $|V(t_v - 1)| < 1000$ and $|V(t_v)| \geq 1000$. Similarly, write the time $t_r$ where $|R(t_r - 1)| < 1000$ and $|R(t_r)| \geq 1000$.

1-4 Write the time $t$ when the vertex $v_0$ creates a cycle for the first time.

\(^{11}\) The meaning of equation (1) is that if the vertex $v_x$ is not an element of $V(t - 1)$, the operation adds $v_x$ to $V(t - 1)$ to generate $V(t)$. The same applies to $v_y$. The meaning of equation (2) is that if the arc $(v_x, v_y)$ is not included in $A(t - 1)$, the operation adds $(v_x, v_y)$ to $A(t - 1)$ and generate $A(t)$.

\(^{12}\) The out-degree of a vertex $v$ is the number of arcs going out of $v$. The in-degree of a vertex $v$ is the number of arcs coming into $v$.\[1\]
Example of Q1. If a text file shown in Figure 1 is given, then Table 1 shows the set of vertices \( V(t) \), the set of arcs \( A(t) \) and the root-set \( R(t) \) at each time.

Finally, the number of vertices \( |V(5)| \) is 6, the size of the set of arcs \( |A(5)| \) is 5, the size of the root-set \( |R(5)| \) is 5. Figure 2 also depicts the directed graphs from time 0 to 5.

Q2 Consider the case of the introduction of the deletion of arcs.

In addition to the operation Add-VA, the operation Del-A is defined as follows: given an arc \((v_x, v_y)\), the following operation is applied to \(G(t - 1)\) to generate \(G(t)\)\(^{13}\):

\[
A(t) = A(t - 1) \setminus \{(v_x, v_y)\}
\]

Similar to the operation Add-VA, the operation Del-A is denoted as follows:

\(\text{x} \rightarrow \text{y}\)

The directed graph \(G_b = (V_b, A_b)\) is the graph which results after applying all operations in the text file b.txt to \(G(0)\). Answer the following questions.

2-1 Write the number of arcs \(|A_b|\) of the graph \(G_b\).

2-2 Write the size of the root-set \(|R_b|\) of the graph \(G_b\).

2-3 Write all the times \(t\) where \(|R(t - 1)| < 1000, \ |R(t)| \geq 1000\).

Q3 Consider the case that vertices are deleted with arc deletions.

Execute the following operation S1 after the operation Add-VA or Del-A every time.

S1 Delete every vertex that is not an element of the root-set \(R(t)\). Also delete arcs going out of the deleted vertex \(v\) and arcs coming into \(v\).

The directed graph \(G_c = (V_c, A_c)\) is the graph which results after applying all operations in the text file c.txt with the operation S1 to \(G(0)\). Answer the following questions.

3-1 Write the number of vertices \(|V_c|\) and the number of arcs \(|A_c|\) of the graph \(G_c\).

Instead of the operation S1, execute the following operation S2 after the operation Add-VA or Del-A every time. The directed graph \(G_c' = (V_c', A_c')\) is the graph which results after applying all operations in the text file c.txt with the operation S2 to \(G(0)\).

S2 Delete every vertex \(v\) except \(v_0\) where the in-degree of \(v\) is 0. Also delete all arcs going out of \(v\). If this operation generates another vertex \(v\) where the in-degree of \(v\) is 0, apply the operation S2 to the resulting graph again.

3-2 Write the number of vertices \(|V_c'|\) of the graph \(G_c'\).

3-3 Analyze the difference between the number of deleted vertices with the operation S1 and the operation S2.

\(^{13}\) The meaning of the equation (3) is that if \(A(t - 1)\) contains the arc \((v_x, v_y)\), then the operation removes \((v_x, v_y)\) from \(A(t - 1)\) and generates \(A(t)\). \(A \setminus B\) means the set of all elements which are members of \(A\) but not of \(B\).
Example of Q2 If a text file shown in Figure 3 is given, then Table 2 shows the set of vertices $V(t)$, the set of arcs $A(t)$ and the root-set $R(t)$ at time $t$.
